

15 In this question, Q represents an atom of chlorine, bromine or iodine.

Which statement about their atoms, molecules or halide ions is correct?

- A** Down the Group, permanent dipole–permanent dipole forces between halogen molecules become stronger.
- B** The first ionisation energy $Q(g) \rightarrow Q^+(g) + e^-$ decreases.
- C** Q_2 reactivity as oxidising agent increases down the group.
- D** The enthalpy change of formation of hydrogen halides becomes more exothermic.
