

- 9** A radioactive element has 2 isotopes, **G** and **H**, with half-lives of 3 days and 6 days respectively. An experiment starts with 4 times as many atoms of **G** as of **H**.

Given that radioactive decay is a first-order reaction, how long will it be before the number of atoms of **G** left equals the number of atoms of **H** left?

- A** 12 days **B** 15 days **C** 24 days **D** 48 days
