

- 1 In two separate experiments, a beam of alpha particles (${}^4\text{He}^{2+}$) and a beam of charged particles **X** were fired with equal velocities into an electric field.

The angle of deflection of the charged particles, ${}^4\text{He}^{2+}$ and **X**, was found to be $+1^\circ$ and $+6^\circ$ respectively.

Which statement is correct?

- A **X** is negatively charged.
- B **X** travels in a straight path towards one of the charged plates.
- C **X** could be a ${}^{12}\text{C}^+$ ion.
- D None of the above.
