

- 21 2g of powdered zinc is completely reacted with 20cm^3 of dilute hydrochloric acid with initial temperature of 20°C .

The experiment is then repeated using 40cm^3 dilute hydrochloric acid with the same concentration and initial temperature as the first experiment and with the same mass of powdered zinc.

How will the maximum temperature change, the total volume of hydrogen gas evolved and the initial rate of reaction in the second experiment compare to the first experiment?

	maximum temperature change	total volume of hydrogen gas evolved	initial rate of reaction
A	decrease	no change	no change
B	increase	increase	increase
C	no change	increase	increase
D	no change	no change	no change
