

- 7 The boiling points of hydrogen bromide, HBr , and hydrogen chloride, HCl , are shown in the table.

	boiling point/ $^{\circ}\text{C}$
HBr	-67
HCl	-85

Which statement explains this difference in boiling points?

- A HBr molecules are smaller than HCl molecules.
- B H-Cl bonds are stronger than H-Br bonds.
- C Instantaneous dipole-induced dipole forces between HCl molecules are weaker than those between HBr molecules.
- D Permanent dipole-permanent dipole forces between HBr molecules are stronger than those between HCl molecules.
