

- 8** Pressurising propane in a cylinder causes it to liquify. It is then sold as 'liquified petroleum gas', LPG. Under the same conditions, methane remains a gas.

Which explains why propane is more easily liquified than methane?

- A** The molecular mass of propane is higher than that of methane.
- B** The propane molecule contains more covalent bonds than that of methane.
- C** The propane molecule contains more electrons than that of methane.
- D** There is more hydrogen bonding between the molecules of propane than there is between the molecules of methane.
