

29 Use of the Data Booklet is relevant to this question.

A dry cell is a type of electrochemical cell that serves as a portable source of electrical energy. The diagram below shows the setup for a dry cell.

The NH_4Cl and ZnCl_2 paste electrolyte are sufficiently mobile to travel to the electrodes.

The half-cell equation for NH_4^+ is shown below.

Which row correctly shows the direction of flow of electrons and the E°_{cell} of the dry cell?

	direction of electron flow in external circuit	$E^\circ_{\text{cell}} / \text{V}$
A	zinc casing to graphite electrode	+1.50
B	zinc casing to graphite electrode	+2.12
C	graphite electrode to zinc casing	+1.50
D	graphite electrode to zinc casing	+2.12
