

- 17 The graph shows how the solubility of a sparingly soluble salt lead(II) chloride, PbCl_2 , changes upon addition of solid potassium chloride, KCl , under constant temperature.

Which statement about the graph is **incorrect**?

- A K_{sp} remains constant along L to N.
- B The change in solubility along L to M is due to increased chloride ion concentration.
- C At M, the molar concentration of Cl^- ions in the solution is twice that of Pb^{2+} ions.
- D The change in solubility along M to N is due to the formation of a complex ion.
