

23 Pepsin is an enzyme.

X is a polyamide.

If pepsin is added to a solution of X, it will catalyse the hydrolysis of an amide bond, forming two products.

Y is a different polyamide. If pepsin is added to a solution of Y no hydrolysis occurs.

Which row is correct?

	the value of the rate constant for the hydrolysis of X	activity of pepsin
A	larger when pepsin is present	pepsin has specific activity
B	larger when pepsin is present	pepsin does not have specific activity
C	smaller when pepsin is present	pepsin has specific activity
D	smaller when pepsin is present	pepsin does not have specific activity
