

28 A sample of ethane gas is produced in which all atoms are either ^{12}C or ^1H .

A sample of chlorine gas is produced in which all atoms are ^{35}Cl .

The two gases are mixed in the presence of ultraviolet light. The chlorine is in excess. A reaction occurs, giving a mixture of products.

The mixture of products is analysed.

What is present in the products?

- A molecules with an M_r value of 65
- B molecules with an M_r value of 98
- C molecules with an M_r value of 100
- D molecules with an M_r value of 152
