

- 24** Orange dichromate(VI) ions, $\text{Cr}_2\text{O}_7^{2-}$, and yellow chromate(VI) ions, CrO_4^{2-} , exist in equilibrium in aqueous solution.

Which statement about this equilibrium is correct?

- A** Addition of a catalyst will shift the position of equilibrium to the right.
- B** Addition of strong alkali will shift the position of equilibrium to the right.
- C** In strong alkali, the solution appears to be orange.
- D** Lowering the pH will increase the concentration of $\text{CrO}_4^{2-}(\text{aq})$ ions.
