

11 Four separate experiments are performed.

- experiment 1 A spatula measure of Na_2O is added to a test-tube of water and the tube is shaken.
- experiment 2 A spatula measure of MgO is added to a test-tube of water and the tube is shaken.
- experiment 3 A spatula measure of Al_2O_3 is added to a test-tube of water and the tube is shaken.
- experiment 4 A spatula measure of SiO_2 is added to a test-tube of water and the tube is shaken.

Which statement is correct?

- A** The pH is the same in experiments 3 and 4 after shaking.
- B** There is no temperature change in any of the four experiments.
- C** Three of the four experiments involve a chemical reaction.
- D** Two of the four experiments will result in a clear solution with no undissolved solid.
