

12 Consider the equilibrium $3\text{P}_2(\text{g}) + 2\text{OP}(\text{g}) \rightleftharpoons 2\text{OP}_4(\text{g})$.

When 4 mol of OP_4 was put into a 2 dm^3 container and heated, the equilibrium mixture contained 0.8 mol of OP .

What is the numerical value of the equilibrium constant, K_c ?

- A** 74.1
- B** 9.26
- C** 0.108
- D** 0.0135
