A zinc-air battery uses oxygen gas in the air as an oxidising agent and zinc metal as a reducing agent. The electrolyte circulating through the battery is NaOH(aq).

An experiment was conducted at room temperature to study the volume of oxygen consumed by the zinc-air battery. It was found that 0.12 cm^3 of oxygen gas was consumed by the battery per minute. What is the $E^\ominus$ value for the cathode and the current, I ?

	$E^\ominus$ value for the cathode / V	current, I / A
A	+1.23	0.0322
B	+0.40	1.93
C	+1.23	1.93
D	+0.40	0.0322
