

3 The boiling point of methane is $-161.5\text{ }^{\circ}\text{C}$ while that of neon is $-264\text{ }^{\circ}\text{C}$.

Why is the boiling point of methane greater than that of neon?

- A** Molecules of methane have a larger surface area to form stronger intermolecular forces than those of neon
- B** A molecule of methane has more electrons than an atom of neon.
- C** A molecule of methane has a greater relative molecular mass than an atom of neon.
- D** Molecules of methane form hydrogen bonds, but those of neon do not.
