

30 Which statement best explains the difference in physical properties between magnesium and iron?

- A** Iron has a higher melting point than magnesium because it forms stronger metallic bonds.
- B** Magnesium is denser than iron because it has a smaller atomic radius and a larger atomic mass.
- C** Iron has a higher first ionisation energy than magnesium because the increase in shielding effect outweighs the increase in nuclear charge.
- D** Magnesium conducts electricity better than iron because it loses electrons more easily.
