

- 14** When a particular chemical reaction occurs in aqueous solution, the temperature of the solution increases.

Which statement about this reaction is correct?

- A** The reaction is an endothermic reaction, where less energy is needed to break bonds than is released when new bonds are formed.
- B** The reaction is an endothermic reaction, where more energy is needed to break bonds than is released when new bonds are formed.
- C** The reaction is an exothermic reaction, where less energy is needed to break bonds than is released when new bonds are formed.
- D** The reaction is an exothermic reaction, where more energy is needed to break bonds than is released when new bonds are formed.
