

- 22** Which statement about a condition used in the Haber process is correct?
- A** An iron catalyst is used in order to get a higher percentage of ammonia in the equilibrium mixture.
 - B** A pressure of 200 atmospheres is used because a high pressure will favour the side of the equilibrium with the greater number of molecules.
 - C** A temperature of 400°C to 500°C is used because a high temperature will increase the rate of reaction.
 - D** A temperature of 400°C to 500°C is used because a high temperature will increase the equilibrium yield of ammonia.

23 Which compound could be formed by the reaction of bromine with an alkene of formula C_4H_8 ?
